

WORKSHOP 1

- The last workshop was made with OOP, the paradigm to define classes

The program calculate the gas consume that made a vehicle (selected previously), the program ask for some details that are important with the purpose of show the consume with detail

The classes were organized in this format

I make all in classes because it could be more escalable and flexible

The superclass is Vehicle and then the other classes such as car, yacht, etc. Appear to clasificate the details that the user write on the code, i think this is one of the best options to do it because it makes more simple the software
